UNEXPLAINED AERIAL PHENOMENA REPORT – ZAZIE PRODUCTIONS
Case ID: ZP-AEP-0328-MID-FL
Date of Event: March 28, 2025
Time Window: 02:43 – 02:51 AM EST
Location Coordinates: 30.4433° N, 84.2807° W
Environment: Edge of Miccosukee Greenway, Leon County, Florida
Weather Conditions: Light fog, 13.7°C, barometric pressure 1010.6 hPa, wind NE at 3.1 km/h
Sky Visibility: Partial clouding, moon waning gibbous, cloud ceiling approx. 1220 meters

FIELD CONTEXT AND INTENT
This occurred during a nocturnal sound-mapping session at the eastern tree line of a low-use section of the Greenway. I was collecting ambient environmental resonance data for unrelated sonic research. No aerial phenomena were expected or sought. Local air traffic records showed no anomalies at the time, confirmed by offline FAA path overlays cached 20 minutes prior.

DESCRIPTION OF THE PHENOMENA
At 02:43 AM, a compact, indigo-blue light appeared at approximately 63 degrees above the horizon. The light did not radiate outward but seemed contained within a hard boundary—no corona, no diffusion. It was visible for 1.3 seconds, then faded. Roughly 20 seconds later, a triangular, tri-lobed object became visible in motion: matte-black, non-reflective, with faint perimeter illumination along each curved edge. The craft's estimated lateral width was 6–9 meters, based on canopy scaling and angular velocity.

Its movement defied conventional flight dynamics. Rather than gliding or banking, it performed abrupt shifts in position—horizontal "jumps" between stationary nodes with no visible thrust or propulsion arc. I have referred to this elsewhere as frame-skipping locomotion. At 02:46, it hovered directly above an open marsh for several seconds, then rotated counter-clockwise by approximately 50 degrees. The rotation took 1.6 seconds and did not disturb the fog layer below.

During this rotation, a low-frequency pressure change was perceptible, similar to cabin pressure equalization on ascent. My left foot repositioned involuntarily by a few centimeters, without conscious intent or loss of balance. There was a timing discrepancy of 1 minute and 33 seconds between two devices I was carrying—both of which had been synchronized 48 minutes earlier.

At 02:51 AM, the object accelerated vertically at high speed on an 87-degree ascent path. It disappeared into cloud cover with no sonic disturbance, light flare, or electromagnetic interference detected on any nearby instruments.

SENSORY AND ENVIRONMENTAL ANOMALIES
Auditory: Sub-bass hum in the 32–40 Hz range during rotation phase, not present before or after

Vestibular: Brief loss of spatial orientation lasting under 4 seconds
Olfactory: None detected
Visual: No strobes, no heat distortion, no known aviation lighting schema
Light Source: Interior or skin-embedded, appeared to pulse internally rather than emit

POST-EVENT OBSERVATIONS
No physical symptoms occurred in the 72 hours following the event. Notably, dream content became unusually geometric in the days after, with multiple sequences featuring aerial lattice grids and silent sky formations. These motifs had not been previously recorded in personal logs.

PERSONAL ASSESSMENT OF NATURE
The object's silence, vector behavior, inertial breaks, and optical profile are inconsistent with any known manned or unmanned aerial vehicles. Based on its performance characteristics and complete lack of physical propulsion artifacts, I consider this to be a non-terrestrial aerial craft or unknown autonomous surveillance mechanism. The craft did not engage directly, but appeared to operate with deliberate awareness of the landscape—either observational or environmental sampling in nature.

It neither fled nor displayed aggression, but its trajectory and motion felt measured and purposeful. The encounter was neither mystical nor chaotic. It felt empirical—like something recording, sampling, or triangulating data from its surroundings.
